Feitian Li

Computer System Technology student · Regina, Saskatchewan, Canada

fl1034nk@gmail.com

Portfolio: https://fl1034.github.io/

Profile

Computer System Technology student seeking a junior developer role. Project experience includes implementing a research-derived numerical solver, building browser database tools, and adapting an open-source game for AI players. Uses mainstream AI coding agents and harnesses alongside documentation, experiments, and tests.

Technical skills

Languages: Rust, C/C++, JavaScript / TypeScript, Go, SQL, Python, Java

AI agent tooling: Mainstream coding agents and harnesses; agent-assisted implementation, debugging, numerical experiments, and validation.

Project technologies: WebGL, DuckDB, WebAssembly, finite element methods, retrieval-augmented generation.

Selected projects

Origami Lab

- Implemented a paper-folding solver from a published finite element method, learning FEM through AI-assisted small-scale numerical experiments.
- Investigated mobile convergence failures affecting roughly 30% of development test cases; traced the issue to FP16 storage precision and resolved the affected failures.

SQL/REPL

- Built the UI and a snapshot-based changeset algorithm for a miniature browser database, prioritizing compute and query efficiency.
- Passed the existing codebase’s insert, edit, and deletion tests; integrated with an existing SQL engine.

5D Chess · AI Spectator

- Adapted an open-source 5D chess game to supply rules and game state to AI players, with retrieval limited to two queries per turn under 50 ms each.
- Observed time travel and timeline branching in approximately 80% of development test cases; token costs limited completed games.

Education

Saskatchewan Polytechnic · Computer System Technology Diploma

2025–2027 · Expected graduation 2027

Object-oriented programming · Java and Python · SQL and relational design · Web fundamentals · Debugging · Collaborative Git workflows
